## Introduction

Digital technology is an important approach for training community health workers (CHWs) called ASHAs (Accredited social health activist) to deliver mental health care in primary care settings in rural India. A very limited number of studies have considered whether digital training programs could build the capacity of the frontline workforce towards improving treatment outcomes for persons living with schizophrenia in low-resource settings.

## Objective

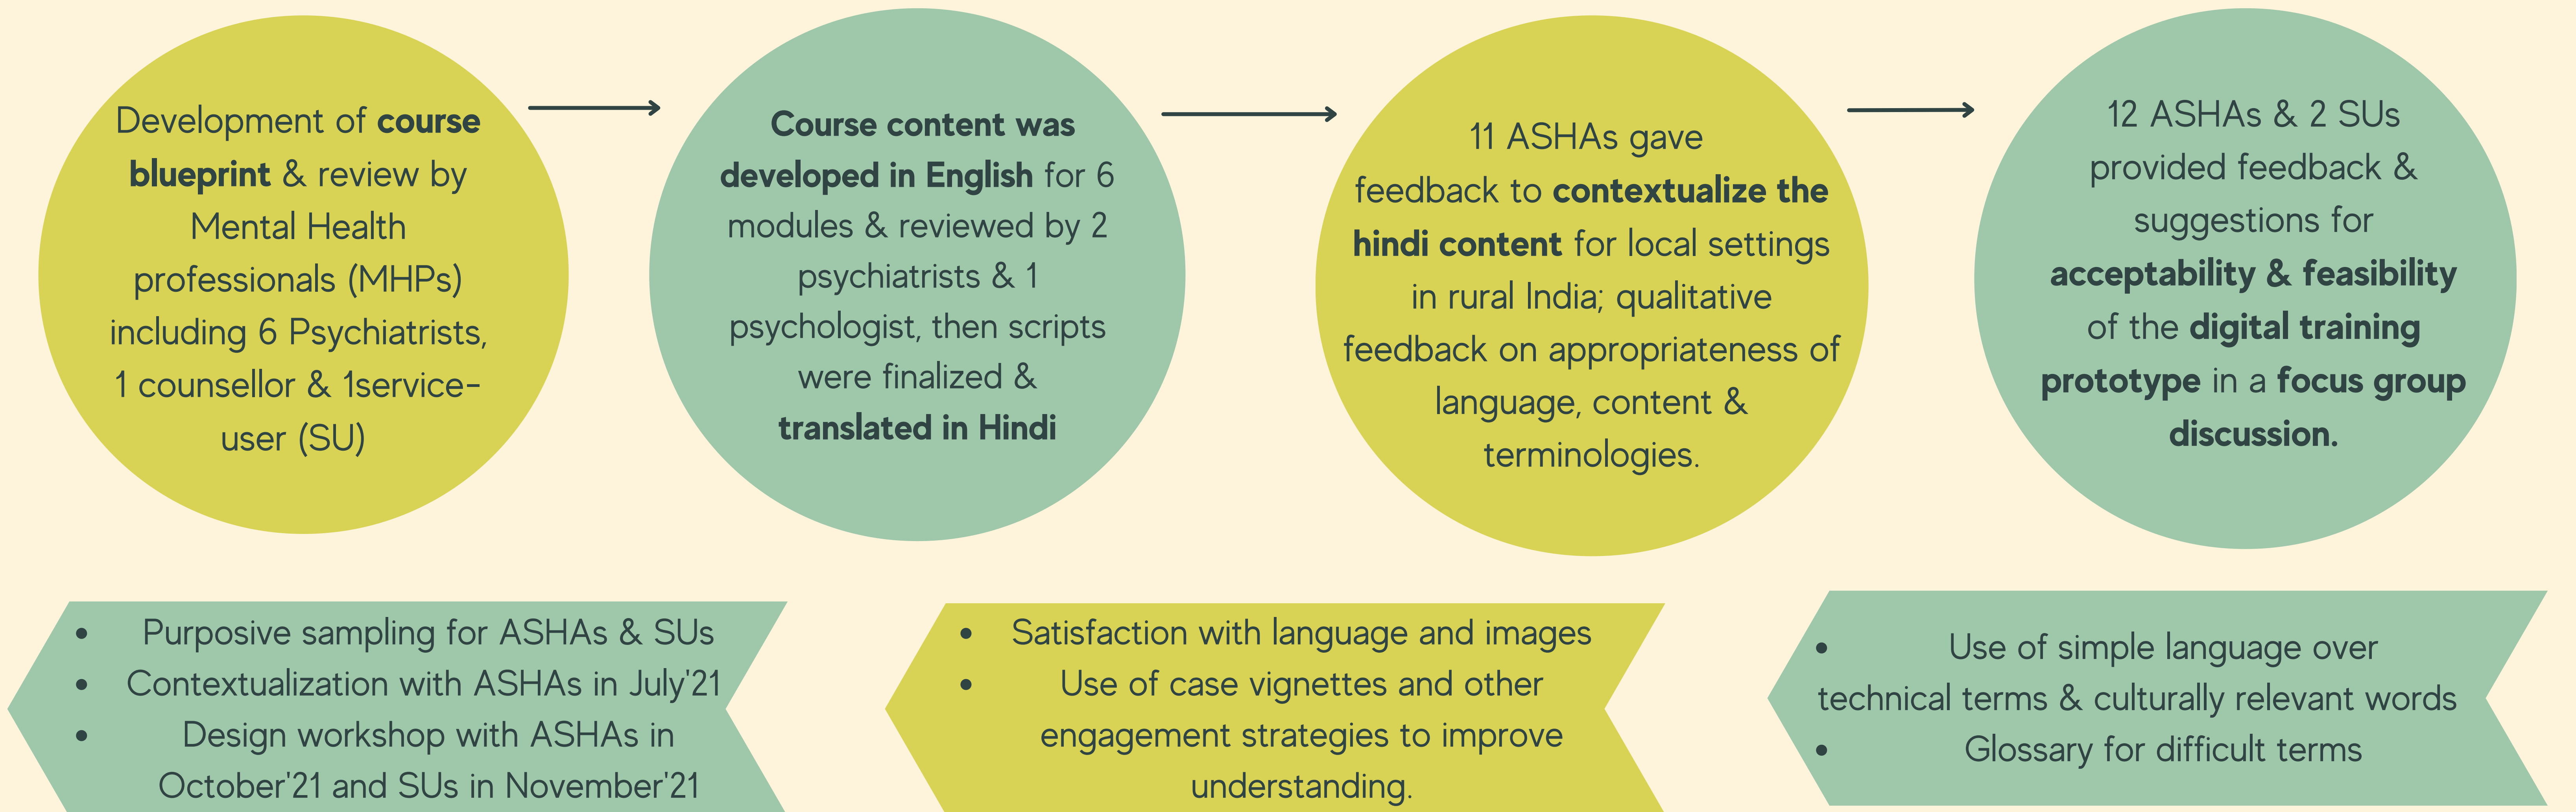

This study aimed to develop and contextualize the content for a digital program for training CHWs in the detection, referral, and follow up with patients with schizophrenia in community settings, and to assess the acceptability and feasibility of this program.

## Methodology

**Study context:** Community health centers in Sehore district of Madhya Pradesh state, India

## Iterative Design & Data Analysis Framework Approach

## Study findings under following themes:

“People with mental illness face discrimination we learned not to stigmatise them”

“We knew that mental illness happens but today we got to know about this illness and its symptoms”

Knowledge gained from digital training program

Satisfaction with the training program

Feasibility of using digital technology

“Saves time as can be done on mobile, able to concentrate better”

“Platform is good more people can get trained”

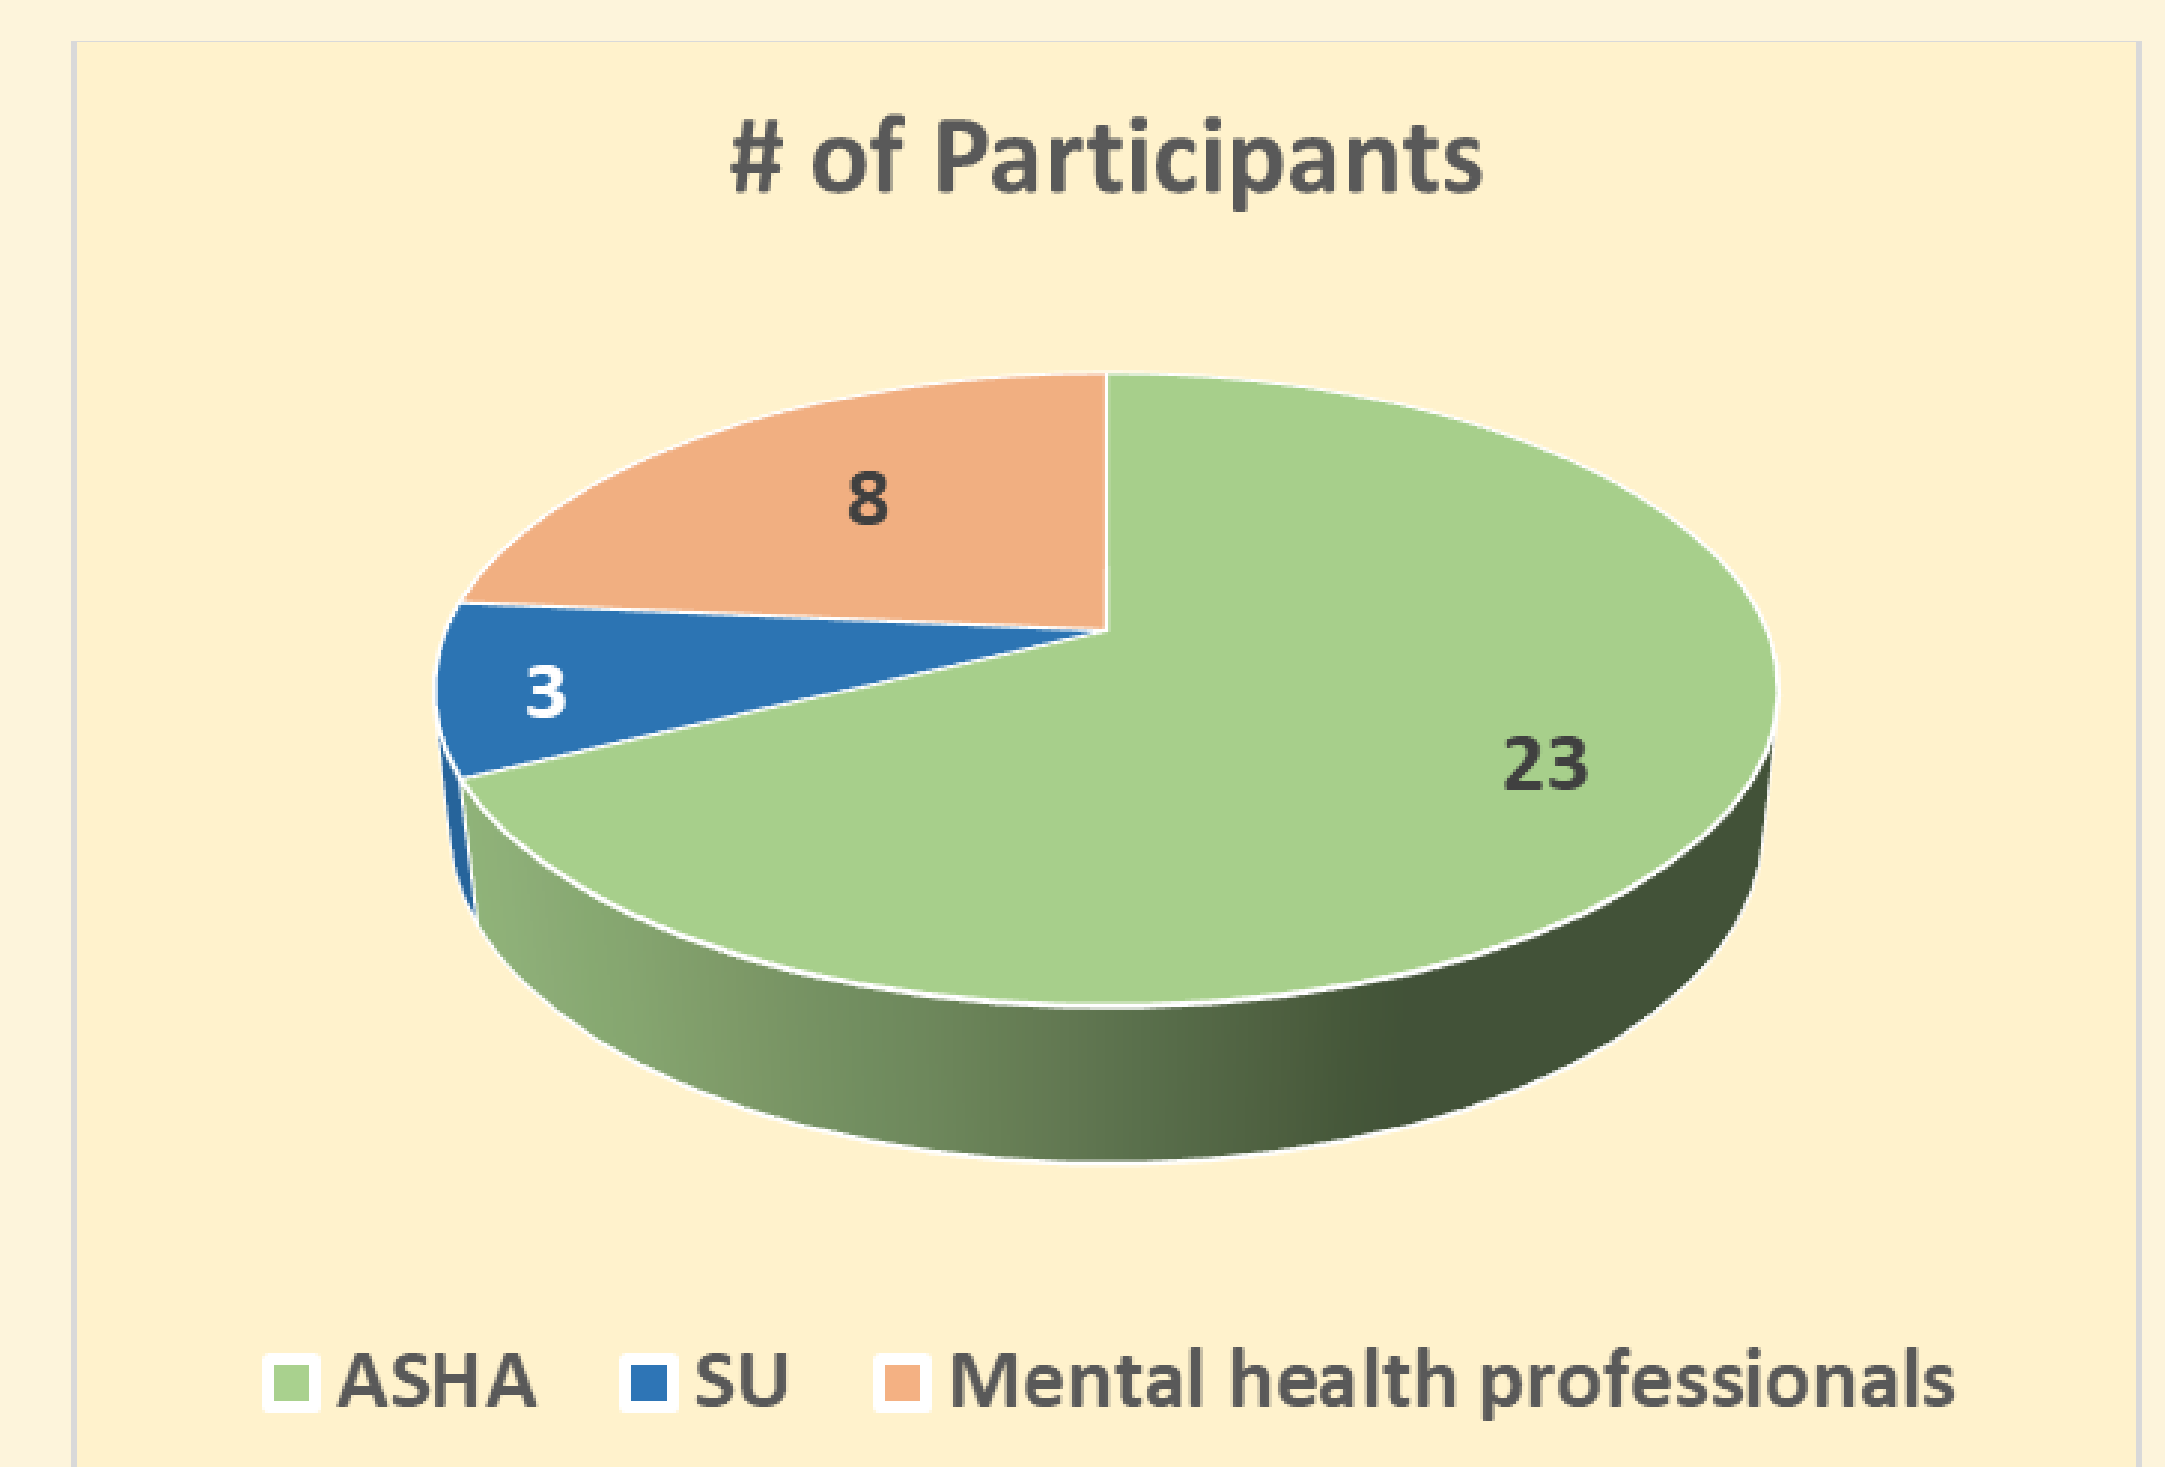

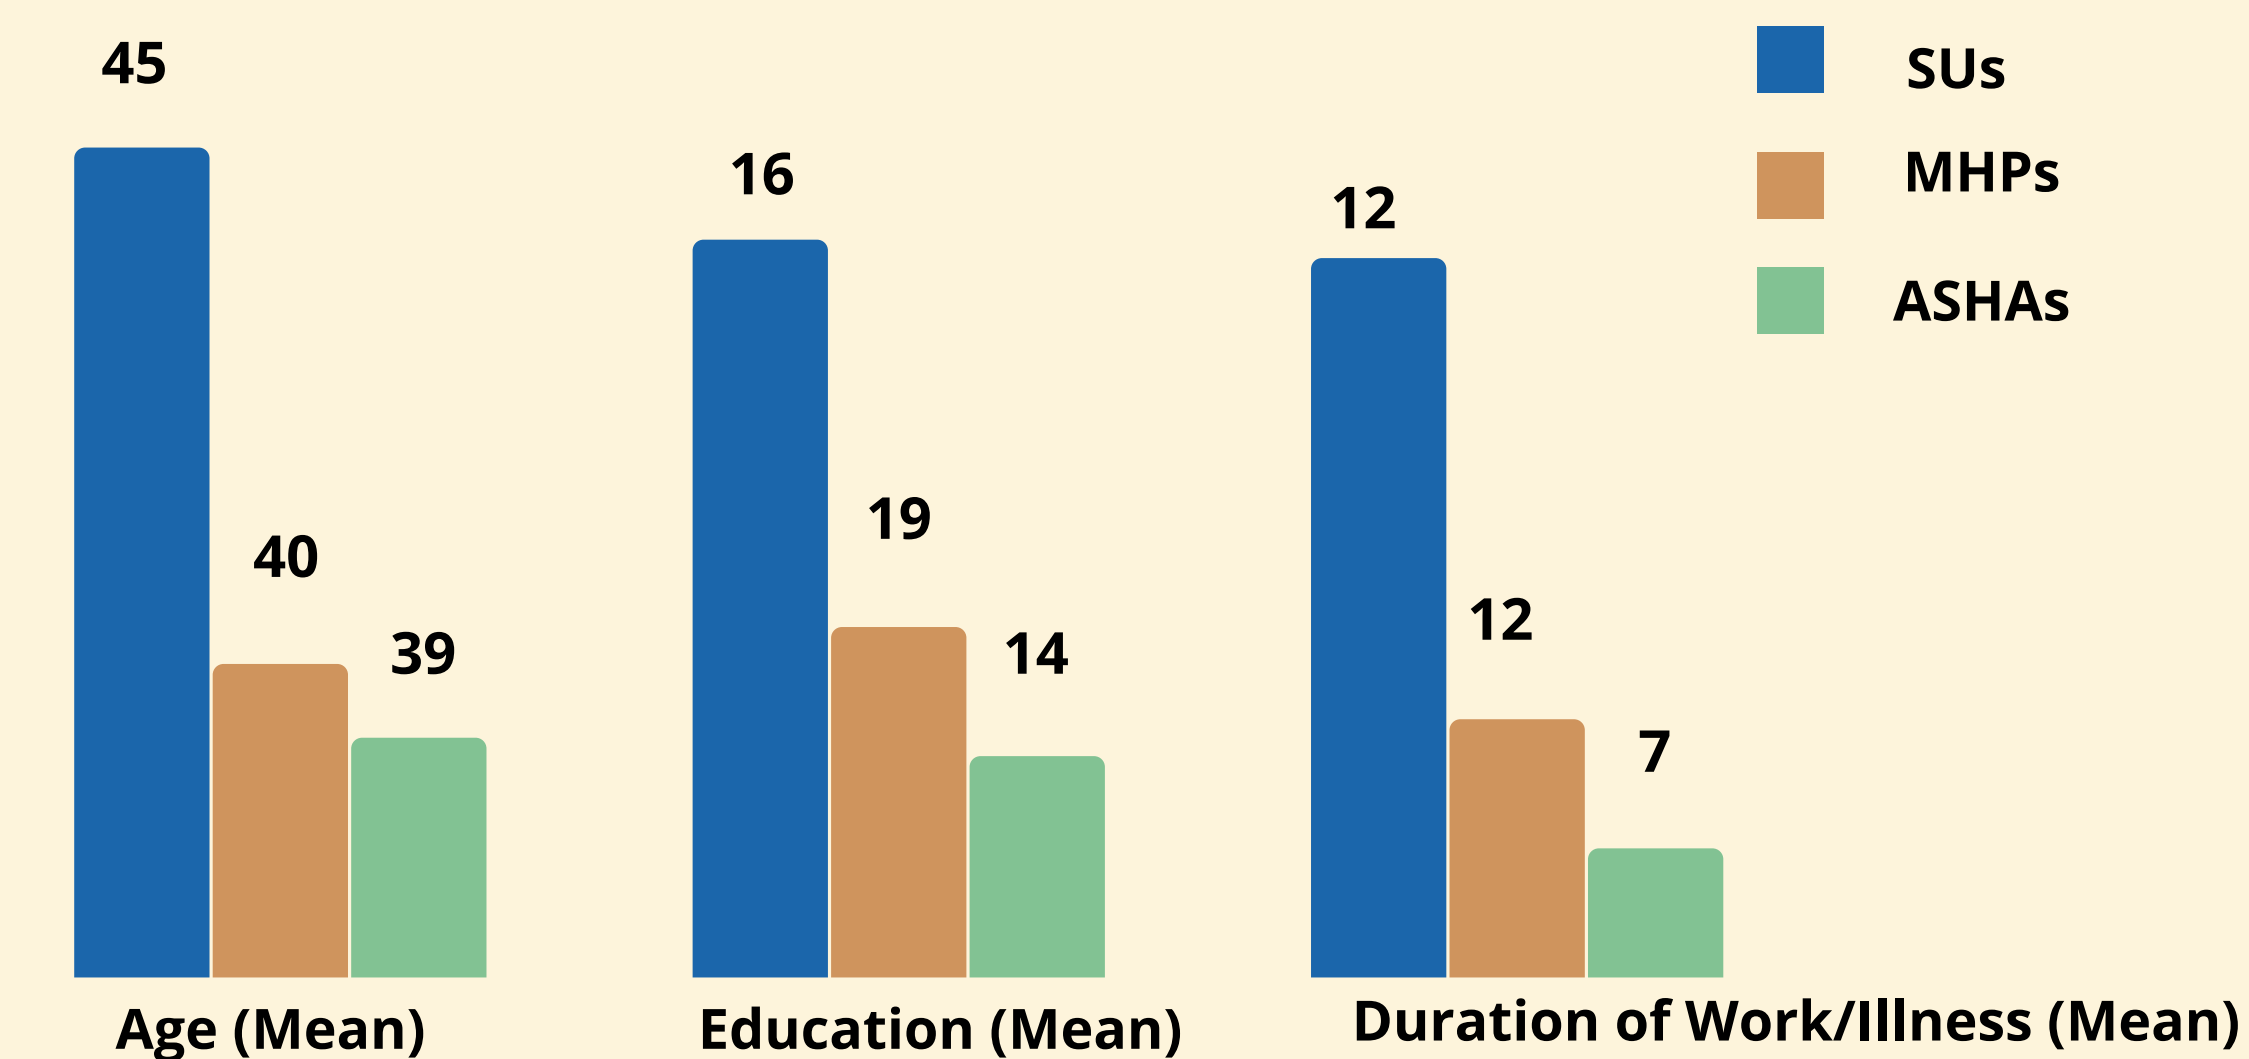

Knowledge & attitude about Severe mental illness

Understanding about usability of the digital training program

## Results

## Socio-demographic characteristics of participants

## Feedback from service-users

- The online medium has a much bigger reach, and can be accessed by thousands of people. It is more convenient as the ASHAs can do it in their free time. “It’s a huge advantage”, “I think it is a good idea”
- It would be helpful for ASHA workers to learn about stigma and they would benefit from understanding the symptoms.
- Having Dos and Don’ts for ASHAs in simple bullet points could be useful to orient them to not behave with patients in a negative manner.

## Discussion

- This study contributes to mounting evidence on the use of digital technology for training CHWs in low-resource settings.
- Continued efforts are necessary to determine if such approaches can specifically develop their skills for identification and referral of schizophrenia.
- We anticipate CHWs beliefs and knowledge on schizophrenia can be changed and they can help in mitigating barriers to accessing treatment for Schizophrenia.
